## DRILLING RIG

When measuring gas pressure using piezo-electric transducers in a test barrel, in some cases a better result can be obtained by drilling the cartridge case. This has to be undertaken with care and precision.

The Drilling Rig comes in a variety of different configurations depending on the projectile calibre under test. A typical rig will comprise the following:

- Holding fixture with drill socket
- Special file (for producing a notch into which the nose of the bolthead or cartridge extractor fits).
- Drill bit in clamping device (2.5mm standard).
