### BARRELS for PRESSURE TESTING (EPVAT)

For ammunition proofing, a standard range of test barrels is normally specified. This is to ensure that the impact of the test environment on the ammunition under test is negligible.

The barrels are fitted to a Universal Receiver, which includes a breech and firing unit.

Standard calibres are 5.56, 7.62x51, 7.62x39 and shotgun type 12/70 and 12/76.

However there are a number of test standards worldwide and barrels can be made to specific requirements.
